

C_1 vs. $C_n \rightarrow$ high? last list (Fb) Prob. reject

C_2 vs. C_n .

odds. for context??

$\rightarrow$ context S_i :

second (first):

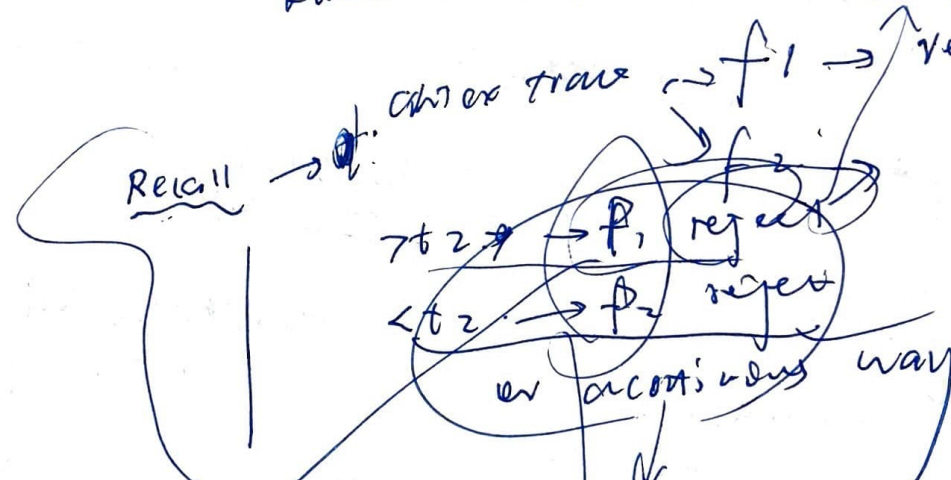

$\text{odds} < 4$

recall $\rightarrow$

Prob. $\rightarrow P_1$ know list # ~~when of 1~~

$\rightarrow P_2$ ~~know~~ list # ~~when of 2~~

$\rightarrow$ reject the trace (not the prob.)

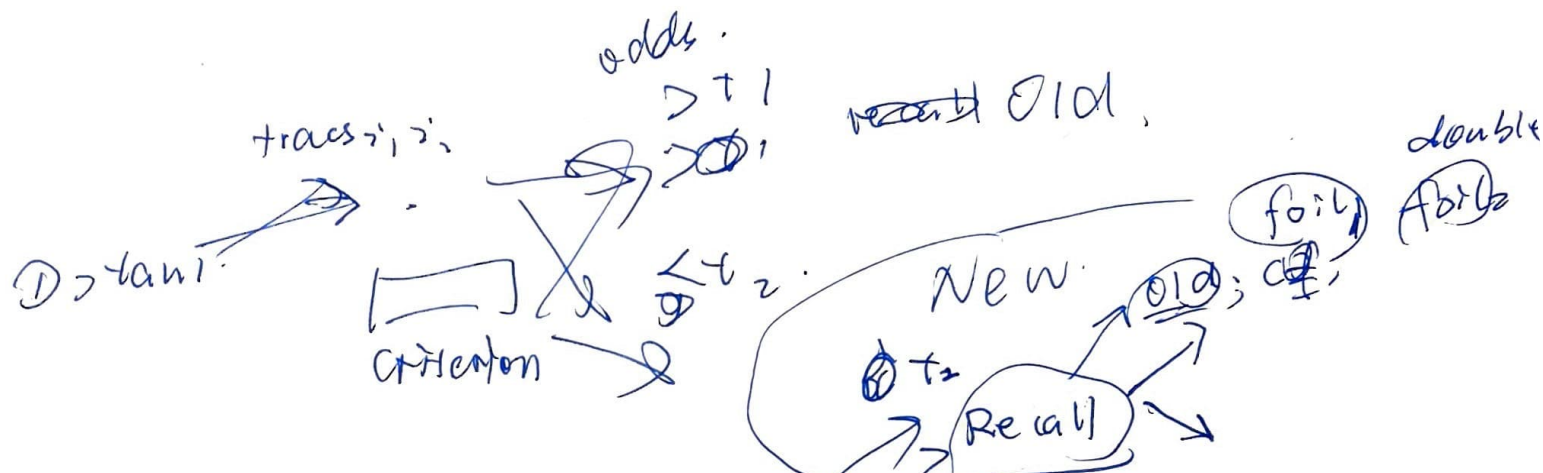

income strengthen.

A kind of association to know which item kind it is.

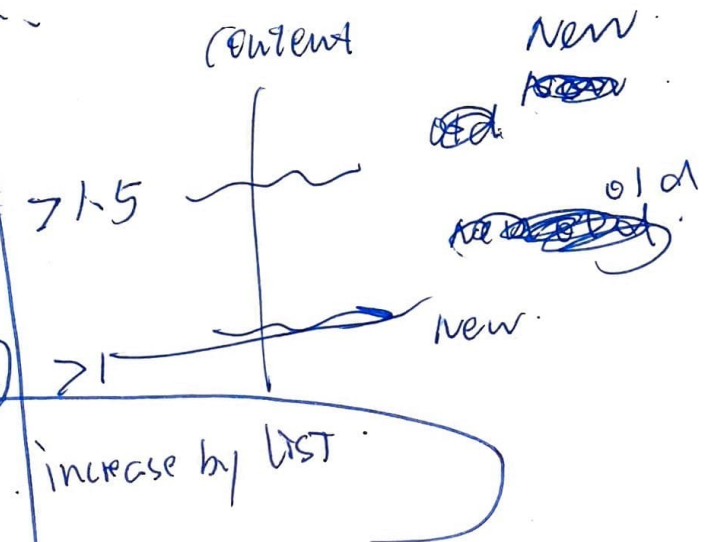

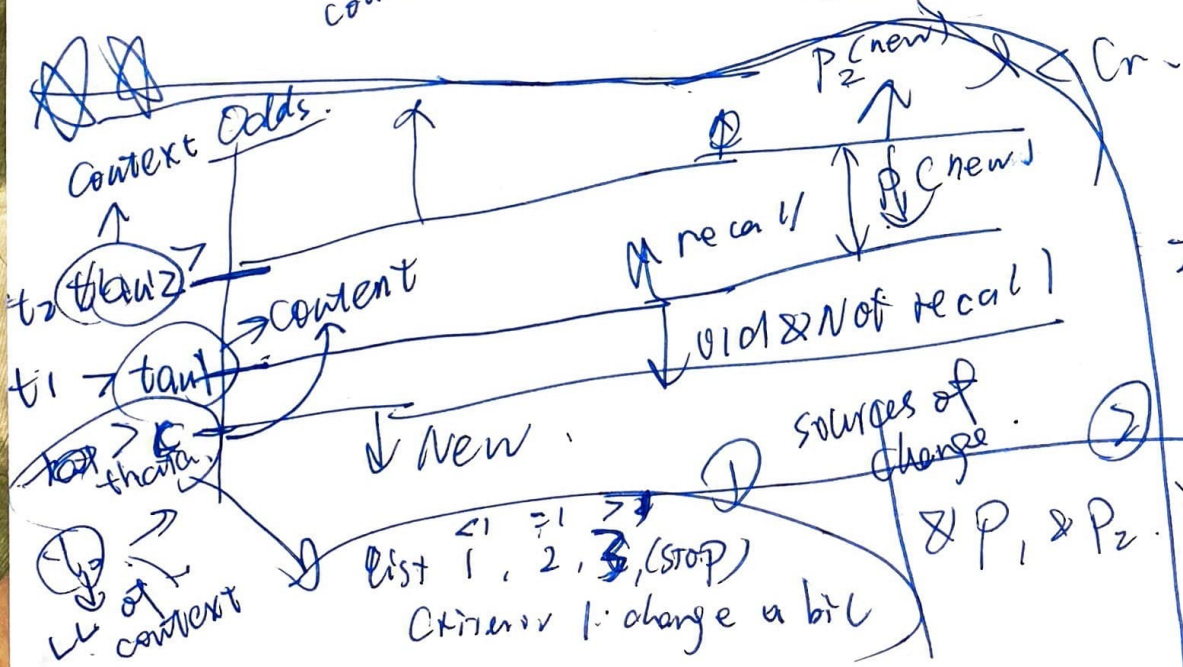

better by having high prob. reject.

how better reject as going $P(Ast) = ?$

possibility ① P_1 & P_2 go up by that (same amount)

Context

vs. My idea:

Second stage filter

??

ok.

old. { similar / density different.
new - reject anyway

Still CCalc list to list
↓
wcc(u)
u(cc)
